

DuraZINC LEED DATA SHEET

LEED SS 7.2 Heat Island Effect

Due to Zinc's low emittance results, it does not satisfy the SRI requirement of 29 or greater for steep slope applications.

LEED MR 4.1 Recycled Content

Our Zinc is composed of a minimum of 10% post-consumer and 40% post-industrial recycled material. For LEED purposes, it qualifies for the 30% minimum required recycled content for the highest level of LEED benefit. Upon completion of its useful service, all Zinc materials are 100% recyclable.

LEED MR 5.1 Regional Materials

Our Zinc may be manufactured into its final construction product at various locations throughout North America, including Architectural Building Component's plant in Houston, Texas. The raw material is extracted and processed into zinc ingot in Clarksville, TN. The ability to satisfy this requirement is based upon the project location

Additional Information

Water runoff from Zinc is completely harmless to vegetation and groundwater.
